

LANCER™

Open Pedicle Screw System

LANCER™

Open Pedicle Screw System

The ChoiceSpine Lancer open pedicle screw system is a posterior spinal fixation system consisting of various polyaxial screws, rods, connectors, and hooks to accommodate various spinal anatomies. Lancer is intended to provide immobilization and stabilization of spinal segments in skeletally mature patients as an adjunct to fusions for degenerative disc disease, spondylolisthesis, trauma, spinal stenosis, deformities, tumor, and/or pseudoarthrosis.

System Features:

- Comprehensive portfolio of screws, rods, hooks and connectors address a wide variety of patient conditions.
- Simple and effective instrumentation makes screw placement and rod reduction easy.
- Ti-6Al-4V rods
- CoCr rods are available for domestic use only.
- Implant and instrument designs allow seamless conversion from Thunderbolt™ MIS.

Screw Features:

- Small/sleek tulip design reduces the anatomical impact.
- Dovetail set screws and tulip threads help minimize head splay and cross-threading.
- Dual-lead screw threads facilitate quick screw insertion.
- Multiple rod connector options available to extend or revise constructs; their open design allows quick rod acquisition and locking for the most challenging scenarios.
