

# LESS = MORE

With minimal instrumentation, the Veo® Lateral Access System is **EFFICIENT** and **EASY TO USE**.

Veo® Lateral Access System is designed to address common concerns with lateral approaches to the disc space.

- **Positioning:** Dual-stage retraction with Veo provides an unobstructed fluoroscopic view of the disc space during targeting.
- **Retraction time:** Dual-stage retraction provides an efficient means for finalizing the pathway to the disc space prior to disrupting the psoas muscle tissue.
- **Unintended disruption of anatomy:** Veo allows direct visualization of the anatomy surrounding and within the pathway to the disc space, which can reduce the risk of unintentionally disrupting the anatomy surrounding and within that trajectory.
